Adopting a Gender-Responsive Approach for Women in the Justice System: A Resource Guide
Introduction

While men still account for the majority of people in the criminal justice system, the proportion of women has been growing steadily over the past several decades. More than a million women are now either in prison or jail or on community supervision. Despite this, criminal justice policies, practices, and programs have historically been designed for men and applied to women without consideration of women’s distinct needs. While gender-neutral approaches—if evidence-based—can be effective in reducing recidivism for both men and women, research has shown that gender-responsive approaches result in far better outcomes for women.

Gender-responsive and trauma-informed policies, practices, and programs recognize that women have distinct histories, pathways to offending, and experiences in the criminal justice system. These approaches address issues that may contribute to women’s involvement in the justice system, such as domestic violence, abuse, and victimization; family and relationships; trauma; and poverty, mental illnesses, and substance use disorders.

This guide to gender-responsive approaches was developed by The Council of State Governments Justice Center in partnership with the National Resource Center on Justice Involved Women. It was originally compiled for Justice and Mental Health Collaboration Program grantees who are working to improve criminal justice and behavioral health outcomes for women in the criminal justice system. However, the guide can help program providers in behavioral health and criminal justice settings across the country develop gender-responsive programs.

The guide focuses on six topics that are fundamental to carrying out effective programs for women in the justice system:

- Foundational Elements for Successful Gender-Responsive Programs
- Key Facts about Women in the Criminal Justice System
- Gender-Responsive Criminogenic Risk and Needs Assessment
- Gender-Responsive Case Management
- Gender-Responsive Programming
- Select Resources

The guide highlights foundational elements for building gender-responsive programs and presents ongoing strategies to help improve responses to women in the criminal justice system. Select organizations, websites, and resources for continuing to advance your gender-responsive programming efforts are also provided. This guide can be used whole or in part, depending on which sections are most relevant to your needs. “Gender-Responsive Criminogenic Risk and Needs Assessment,” “Gender-Responsive Case Management,” and “Gender-Responsive Programming” exist as independent fact sheets as well as in this guide.
Foundational Elements for Successful Gender-Responsive Programming

Planning and implementing evidence-based programming with fidelity—including gender-responsive programming—can present an array of challenges. Among the many decisions behavioral health and criminal justice program providers must make are how to manage referrals to the program, engage participants, tailor program dosage and intensity, respond to behaviors fairly and consistently, and collect and analyze data to measure performance. Efforts to ensure program sustainability (once grant funding ends, for example) can be even more difficult, as can obtaining full support from criminal justice and community stakeholders and producing desired outcomes over time. And most program providers will need to plan and implement such activities for multiple programs at a time. Considering these factors at the outset of planning can help providers implement programming more effectively and ensure that they are capable of yielding long-lasting positive effects. Below are best practices for planning and implementing any program, but especially gender-responsive ones.

Engage stakeholders.

You should engage and gain buy-in from people who have (or should have) a stake in your program’s success or who may be natural allies during program planning and implementation. This can be critical to growing and sustaining support for your program. As you work to adopt a gender-responsive approach, people who can bring important perspectives in these areas, such as women’s and victim services organizations, will be important to engage. Additional stakeholders include criminal justice decision-makers (e.g., judges, law enforcement leaders, prosecutors, defense attorneys, sheriff/jail administrators, and probation supervisors), community organizations (e.g., faith-based organizations, recovery centers, treatment providers, community-based advocates), state/local government officials, and funders.

Examples of how to engage stakeholders:

• Host a stakeholder meeting to launch the program.
• Once the program is up and running, invite stakeholders to observe it in action or to attend a program event (for example, a graduation).
• Conduct one-on-one or small group discussions to inform people about the program’s progress at important intervals and to solicit their input throughout implementation.
• Ask to be included on the agenda of meetings with partner groups or organizations to provide regular updates about the program.
• Pitch news articles about the program to local newsletters and newspapers.
• Conduct training events to increase stakeholder knowledge and engagement about the issues facing women in the criminal justice system.
• Consider whether the program may benefit from an advisory group. Ideally, this group would be composed of a diverse group of people who add value and can advocate for the program.
Conduct a strengths, weaknesses, opportunities, threats (SWOT) analysis of the program.

This should be done at important intervals, such as the beginning of new activities or programs or before revamping policies, to note successful strategies and ongoing issues to address. A SWOT analysis begins with identifying the program’s strengths and opportunities for enhancement and expansion, including existing efforts to apply a gender-responsive approach. Second, it involves identifying the program’s weaknesses and any barriers or challenges in using a gender-responsive approach to accomplish identified goals. Once those analyses are completed, the team can identify strategies for building on the strengths and opportunities for addressing weaknesses and challenges. Next, create a work plan with specific details on implementing gender-responsive best practices based on the analysis that match your initiative’s needs.

Develop a criminal justice “system map.”

Developing a flowchart of how women come into contact with and move through the criminal justice system and engage in behavioral health services is critical to understanding where interventions and supports can be most useful. Similar to mapping using the Sequential Intercept Model, communities can often use this process to identify the volume of women flowing through each criminal justice decision point and what resources, decisions, and gaps are present at each point. By design, mapping is a group endeavor that may take hours or days to complete depending on how detailed the map is. This is because the process brings together decision-makers and staff across organizations to articulate the decisions they make at various points in the system. Mapping can increase everyone’s awareness of how the entire system functions and how different parts of the system interact with one another. Most importantly, however, teams should determine where a program fits on the map to make sure it has the greatest impact. Exploring key gaps can help identify current and future opportunities to enhance gender-responsive services in the jurisdiction. The mapping group can also discuss whether additional action steps are needed to ensure that the new gender-responsive initiative/program is able to achieve its intended outcomes.

Conduct a Gender-Responsive Policy and Practice Assessment (GRPPA).

Developed by the National Institute of Corrections and the Center for Gender and Justice, the GRPPA is an interactive instrument for evaluating current gender-responsive policies and practices. The GRPPA is intended for use by policymakers and practitioners to assess the strengths of and gaps in current resources for women in the criminal justice system. Conducting a GRPPA can help program providers gain a better understanding of how their current policies and practices affect women in the criminal justice system and inform strategies for enhancing or expanding a gender-responsive approach.

---

5. The Sequential Intercept Model (SIM) guides community and system-wide responses to people with mental illnesses and substance use disorders in the criminal justice system. SIM focuses on six discrete points of potential intervention (also known as intercepts) in the criminal justice system at which a person who has behavioral health needs might be screened, assessed, and connected to treatment. These six points are (0) community services, (1) law enforcement, (2) initial detention/initial court hearings, (3) jails/courts, (4) reentry, and (5) community corrections. See Policy Research Associates, The Sequential Intercept Model: Advancing Community-Based Solutions for Justice-involved People with Mental and Substance Use Disorders (New York: Policy Research Associates, 2018), https://www.prainc.com/wp-content/uploads/2018/06/PRA-SIM-Letter-Paper-2018.pdf.
**Build collaborative partnerships.**
It is difficult, and perhaps impossible, to implement effective programs in isolation. This is especially true when working with women in the criminal justice system who often have myriad needs that must be addressed by multiple agencies if they are to be successful. By working collaboratively with partners, you can help ensure that multiple services are provided in a coordinated and efficient way. When building partnerships, you should consider how various agencies and organizations can help enhance and sustain service delivery to the women your program serves. Further, there may be opportunities through these collaborations to better coordinate gender-responsive services.

**Tips for building and sustaining successful partnerships:**
- Consider the strengths each partner can bring to the collaboration and how those strengths can be enhanced.
- Establish clear roles and responsibilities for each partner and conduct regular multidisciplinary team or case conferencing meetings at the direct service level to examine how the team is working together.
- Identify existing resources from each partner that can be used to help address any gaps at various points in the system.
- Provide cross-system training opportunities so that all staff in the partners’ organizations are knowledgeable and clear about program goals and objectives as well as gender-responsive and trauma-informed approaches.

**Develop a communications strategy that tells your story and builds awareness about women in the criminal justice system.**
A communications plan will help facilitate support for your program and lift up its profile in your community. The communications plan can include an approach to raise awareness about women in the criminal justice system by highlighting their distinct needs and addressing misconceptions about how they become involved in the system.

A communications plan should also promote the program’s benefits and successes. To best do this, teams should collect quantitative and qualitative data on the outcomes of the women participants from the very beginning. Quantitative data may include recidivism measures (e.g., rearrests, reconviction, reincarceration, revocations), length of time spent in custody, incidents in custody, behavioral health treatment connections and recovery supports, as well as education attainment, employment, and housing placement. Qualitative data can include the number of referrals to treatment and other support services, engagement in these services, participant feedback, and staff satisfaction surveys. Women in the program sharing their lived experiences can also be invaluable in presenting the impact of programming and often more compelling than providers telling their stories for them.

Data and information that has been collected can then be used as part of an engagement strategy with media, the community, and external stakeholders (such as elected officials) about the benefits and successes of the program. The data can also help determine what adjustments to the program and/or to the larger behavioral health and criminal justice systems may be needed.

**Questions to consider when developing a communications plan:**
Who are the key audiences you want to communicate with? Why? For each audience you identify:
- What are the most useful ways to reach them (i.e., social media, personal appeals, newspapers)?
- What do you want them to know?
- What is their perspective (for example, do they have a positive outlook on women in the criminal justice system)?
- Who from the program is best positioned to communicate with them?
Key Facts about Women in the Criminal Justice System

Contrary to common misconceptions, the proportion of women in the criminal justice system has increased dramatically over the past several decades. Women in the criminal justice system have markedly different experiences from those of men. Women follow unique pathways into the criminal justice system and can present patterns of criminogenic risk that point to different intervention needs. However, program providers, correctional personnel, community supervision agents, and others working with women often do not have a full understanding of some of these differences. This section provides some basic facts about women in the criminal justice system and highlights information that can be used to inform gender-responsive approaches and program planning.

Women are a significant and growing population in the criminal justice system. Since 1980, the number of women in U.S. prisons has increased by more than 700 percent and outpaced men by more than 50 percent. And while arrests have dropped overall in recent years, the decrease is more pronounced for men (down 22.7 percent from 2005 to 2014) than it is for women (down 9.6 percent in the same period). In fact, more than 1.3 million women were arrested in the U.S. in 2014. And the number of women in local jails increased 44 percent between 2000 and 2013. Additionally, 1.2 million women were under some form of correctional control in 2013. A recent study that examined incarceration rates for women worldwide found that the 25 jurisdictions with the highest rates of incarcerating women were individual U.S. states. Transgender women, especially transgender women of color, are also incarcerated at higher rates than other groups. A 2011 survey found that approximately 21 percent of transgender women have been incarcerated in jail or prison at some point in their lives.

Further, many of the policies and practices that were put in place in the past 30 years have directly affected the rise of women in the criminal justice system, such as state and national drug policies that mandated prison terms for even relatively low-level drug offenses, changes in law enforcement practices (particularly those targeting neighborhoods of color), and post-conviction barriers to reentry that distinctly affect women. Between 1986 and 1999, for example, the number of women incarcerated in state facilities for drug-related offenses alone increased by 888 percent (compared to an increase of 129 percent for non-drug offenses). These policies had an even greater impact when accounting for the intersections of gender, race, and ethnicity. While recently there has been a notable dip in the incarceration rate of Black women, in 2014 alone, the imprisonment rate for Black women was still more than twice the rate of imprisonment for White women. For Latina women, incarceration rates were 1.2 times the rate of White women in 2014.

Women’s recidivism rates are similarly troubling compared to men’s. As of 2010, about one-quarter of women released from prison returned to custody within 6 months (i.e., were arrested for a new crime), one-third returned within a year, and two-thirds returned (68.1 percent) 5 years after release. Figure 1 shows recidivism rates of men and women released from prison in 30 states in 2005.

18. The Sentencing Project, Fact Sheet.
Women have different “pathways” to crime.20

Research conducted over the past two decades has identified some distinct drivers of criminal behavior among women and girls. While there is not one single, dominant pathway that leads women to enter the criminal justice system, particular types of experiences can trigger them to engage in behavior that results in an arrest. Some common factors that have emerged in research include experiences of abuse or trauma, mental illnesses and/or substance use disorders, poverty, marginalization, and unhealthy relationships.21

- Childhood victimization drives some girls to run away from home and use illegal drugs as a means of coping with the trauma of physical and sexual abuse. Selling drugs, engaging in prostitution, and participating in burglary can then sometimes follow as a means of street survival.22
- Women who experienced childhood victimization sometimes resort to using drugs to cope with the pain of that abuse as well as other stressors in their lives, such as intimate partner violence, sexual assault, or grief over the loss of custody of their children. Thus, there is a connection between prior or current victimization, mood and anxiety disorders (e.g., depression, anxiety, and post-traumatic stress disorder [PTSD]), and substance using behaviors (i.e., self-medicating).23
- Poverty or economic reasons can motivate some women to sell drugs, engage in prostitution, or commit other crimes to support themselves and/or their children. They may also participate in these activities to support an addiction or a partner’s addiction.24
- A smaller proportion of women appear to be primarily economically motivated and do not have a substance use disorder. Their arrests are instead related to the poor economic conditions they face.25
- Women often get into and out of the criminal justice system in the context of unhealthy relationships (e.g., a male partner who encourages substance use or prostitution) or familial obligations. Research on female psychological development illuminates how women’s identity, self-worth, and sense of empowerment are defined by and through their relationships with others.27 In contrast, men’s major developmental issues are achieving autonomy and independence.

25. For further information on how this pathway more closely resembles male criminality, see Merry Morash, Women on Probation and Parole: A Feminist Critique of Community Programs and Services (Boston, MA: Northeastern University Press, 2010).
27. Bloom, Owen, and Covington, Gender-Responsive Strategies.
Women come to and experience the criminal justice system differently.

Most women not only encounter the criminal justice system for different reasons than men, but they also experience the system differently, have differing risk factors for reoffending, and have varied life circumstances. For example, women are more likely than men to commit drug offenses, such as possession and trafficking (see Figure 2), and women under correctional supervision are more likely than men to report having experienced physical and sexual abuse as children and adults.

<tr>
<th>Family Roles/Relationships</th>
<th><strong>WOMEN</strong></th>
<th><strong>MEN</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Women are more likely to have served as the primary caretakers of children prior to entering prison and have plans to return to that role upon release. For many women, their children are often the primary factor motivating them to reduce recidivism. Women in the criminal justice system are often concerned with their children's welfare and the potential loss of legal custody. For instance, the Adoption and Safe Families Act of 1997 requires termination of parental rights when a child has been in foster care for 15 or more of the past 22 months. Given that average prison terms for women are 18 to 20 months, this time period has particularly serious consequences for incarcerated mothers. Sense of self-worth is often built from their connections with others.</td>
<td>Men are less likely to serve as the primary caretaker of children. Psychological theories describe men's path to maturity as becoming self-sufficient and autonomous.</td>

<th><strong>Victimization and Trauma</strong></th>
<th><strong>WOMEN</strong></th>
<th><strong>MEN</strong></th>
</tr>
</thead>
</table>
| A number of studies have found that about half of women in the criminal justice system report experiencing some kind of physical or sexual abuse in their lifetime, with some studies noting rates of trauma histories as high as 98 percent.  
Most common experiences include child and adult sexual violence and intimate partner violence.  
While the risk of abuse for men drops after childhood, the risk of abuse for women continues throughout their adolescent and adult lives.  
Some women have also reported that victimization continues while they are incarcerated, either at the hands of staff or other incarcerated women. | | Most common past traumas include witnessing someone being killed or seriously injured and being physically assaulted. |

71. Ibid.
Gender-Responsive Criminogenic Risk and Needs Assessment

The Problem

Criminogenic risk and needs assessments help guide decision-making at various points across the criminal justice continuum by estimating a person’s likelihood of recidivism. Some of these assessment instruments also identify individualized risk/need profiles, which assist in determining appropriate programs, interventions, and supervision levels to mitigate that risk. Most of these tools are designed to be gender neutral and do not provide as much additional information about women’s criminogenic risks and needs as gender-specific instruments do. Some risk factors critical to women (e.g., relationship conflict, housing safety, and mental health) are often absent in gender-neutral tools altogether. And despite the fact that strengths and protective factors, such as self-efficacy, family support, and education, have been shown to significantly impact women’s recidivism outcomes, gender-neutral tools do not examine or weigh these items differently for men and women. As a result, research suggests that gender-neutral tools are less valid for women than for men and may overclassify women into higher risk categories than their behaviors warrant.

72. Wright et al, Gender-Responsive Lessons Learned.
73. Ibid.
74. Hardyman and Van Voorhis, Developing Gender-Specific Classification Systems.
Applying a Gender-Responsive Approach

Gender-responsive criminogenic risk and needs assessment instruments incorporate the same principles as traditional gender-neutral assessments but also examine gender-responsive factors for women. These assessments weigh risk factors differently and include risk factors that are predictive for women only, such as depression, anxiety, and unhealthy relationships.75

Table 2 provides information about gender-responsive risk and needs assessment tools and additional tools that are useful when working with women in the criminal justice system. The results of these assessments will be critical to tailor programming to meet the distinct needs of women, make pretrial risk decisions, and determine the intensity level of community-based supervision.

Gender-Responsive Case Management

The Problem

Risk assessment, classification, and programming processes in the criminal justice system were developed with the needs of men in mind. Similarly, case management approaches—which seek to connect people to needed social, medical, behavioral health, housing, and other services—have not fully taken into account the distinct needs of women. As a result, gender-responsive case management models have been created to better respond to women’s complex risks and needs and to connect them with resources and treatment to support successful reentry and recovery in the community.

Applying a Gender-Responsive Approach

The Women Offender Case Management Model (WOCMM), now known as Collaborative Case Work with Women (CCW-W), is a case management model designed specifically for use with women in the criminal justice system. CCW-W uses gender-informed, evidence-based practices to support women’s recovery and success in the community while minimizing risk of further involvement in the criminal justice system. It was developed by the National Institute of Corrections and Orbis Partners to provide uninterrupted, coordinated services that can begin at sentencing and continue through community reentry and supervision. It is facilitated by a case manager who meets with a multidisciplinary team that can include medical personnel, treatment specialists, institutional staff, parole/probation officers, community providers, family members, mentors, and the woman herself.

The model is based on nine core principles:
1. Provide comprehensive case management that addresses the complex and multiple needs of women in the criminal justice system.
2. Recognize that all women have strengths that can be mobilized.
3. Ensure that women are collaboratively involved to establish desired outcomes.
4. Promote services that are unlimited in duration.
5. Match services in accordance with risk level and need.
6. Build links with the community.
7. Establish a multidisciplinary “case management team.”
8. Monitor progress and evaluate outcomes.
9. Implement procedures to ensure program integrity.

Collaborative comprehensive case plans (CC case plans) can also be used to assist case planners and others with better integrating behavioral health and criminogenic risk and needs information into case plans that actively engage women in the criminal justice system. Like the CCW-W model, CC case plans involve collaboration between criminal justice, behavioral health, and social service systems to achieve more successful outcomes with women. They also specifically include gender considerations as one of the 10 priority areas of focus, because women often have different behavioral health needs and responsivity factors than men.

In Practice: Connecticut implemented the CCW-W with women in the Bridgeport, Hartford, New Britain, and New Haven probation sites and is seeing promising results. In one outcome evaluation of 174 women being supervised by the State of Connecticut Judicial Branch/Court Support Services Division, one-year follow-up data revealed that CCW-W participants had a significantly lower rate of new arrests in comparison to members of the matched control group (31.6 percent vs. 42.5 percent). The rate of any new arrests for high-risk CCW-W participants was also 36.1 percent compared to 49.5 percent for high-risk matched control group members.*

Gender-Responsive Programming

The Problem
Existing gender-neutral correctional and community programming has historically been developed for men and as such has not taken into account the unique pathways of women into the criminal justice system. Women also have distinct criminogenic risks and behavioral health needs that must be addressed to support successful reentry, recovery, and recidivism reduction.
Applying a Gender-Responsive Approach

Gender-responsive programs seek to meet the specific needs and challenges of women in the criminal justice system. Program content recognizes the unique pathways that often lead women into contact with the criminal justice system. Interventions are also tailored to meet women’s criminogenic risks and needs, including parenting stress and mental health issues. In addition, applying a gender-responsive approach to programming recognizes women’s high rates of past and recent trauma (which may interplay with other behavioral health needs) and incorporates a trauma-informed approach and/or trauma treatment into programming as needed.93

Table 3 highlights programs that have been found to be effective when working with women in the criminal justice system. This table can be used to explore evidence-based programming options for women both pre- and post-release (or to enhance existing intervention protocols).

Table 3 Continued

| Beyond Trauma: A Healing Journey for Women<sup>97</sup> | The Beyond Trauma program incorporates the insights of neuroscience with the latest understanding of trauma and PTSD. The materials are designed for trauma treatment, although the connection between trauma and addiction in women’s lives is a primary theme throughout. The program is based on the principles of relational therapy; it uses cognitive behavioral techniques, mindfulness, expressive arts, and body-oriented exercises. | Studies on the program’s use in women’s prisons indicate the importance of addressing both trauma and substance use disorders in women’s recovery.<sup>98</sup> Positive changes were found in specific domains of the Texas Christian University (TCU) Criminal Thinking, TCU Psychological Adjustment, and TCU Social Functioning scales for women who completed a combined Helping Women Recover/Beyond Trauma program at an Oklahoma women’s prison.<sup>99</sup> Additional studies show that women who participate in Beyond Trauma demonstrate a decrease in depression, improvement during parole, increased participation in voluntary aftercare treatment services, decreased likelihood of being incarcerated at 6-month follow-up, and reported reduction in PTSD.<sup>100</sup> |
| Beyond Violence: A Prevention Program for Criminal Justice-Involved Women<sup>101</sup> | Beyond Violence (BV) utilizes a multi-level approach and a variety of evidence-based therapeutic strategies (i.e., psychoeducation, role playing, mindfulness activities, cognitive behavioral restructuring, and grounding skills for trauma triggers) to assist women in understanding trauma, the multiple aspects of anger, and emotional regulation. | BV’s use with incarcerated women shows significant reductions in PTSD, anxiety, anger, aggression, and symptoms of serious mental illness.<sup>102</sup> Preliminary results from a pilot BV program in one correctional facility in Michigan showed that during the first year on parole, BV participants were less likely to recidivate (33 percent of BV participants vs. 40 percent of non-participants); were less likely to test positive for drugs (58 percent vs. 80 percent); and produced fewer positive drug screens (average number of positive drug tests per person was 1.88 for those in the outpatient BV group vs. 3.6 positive tests for those in the “treatment as usual” outpatient substance use group of women with violent offenses). BV participants also had better treatment adherence outcomes.<sup>103</sup> |

<table>
<thead>
<tr>
<th>Boston Consortium Model (BCM): Trauma-Informed Substance Abuse Treatment for Women</th>
<th>The BCM program “provides a fully integrated set of substance use treatment and trauma-informed mental health services to low-income, minority women with co-occurring alcohol/drug addictions, mental disorders, and trauma histories.”</th>
<th>A quasi-experimental study found decreased substance use and related problem severity; fewer mental health symptoms, including decreased PTSD from the 6- to 12-month follow-up, and decreased risky sexual behavior from baseline to the 6-month follow-up for women in the BCM group compared to women in usual substance use disorder treatment.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dialectical Behavioral Therapy (DBT)</td>
<td>DBT is a cognitive behavioral approach involving skills training, motivational enhancement, and coping skills.</td>
<td>DBT has been tested in many settings and has been found to increase intermediate outcomes, such as reductions in drug use, suicide attempts, and eating disorder measures, and improvements in mental health symptoms. One study of girls in the juvenile justice system found reductions in behavioral problems.</td>
</tr>
<tr>
<td>Engaging Women in Trauma-Informed Peer Support</td>
<td>This guide was created by the National Center on Trauma-Informed Care and is designed as a resource for peer supporters in behavioral health or other settings who want to learn how to integrate trauma-informed principles into their relationships with the women they support or into the peer support groups of which they are members. The guide provides information, tools, and resources needed to engage in culturally responsive, trauma-informed peer support relationships with women.</td>
<td>Research demonstrates that peer support contradicts many of the negative messages received through traumatic experiences and service systems about victims’ identity and capabilities.</td>
</tr>
</tbody>
</table>

106. While DBT was not developed specifically for women involved in the justice system, it addresses abuse and trauma in a manner relevant to the population. For a description of DBT, see Marsha M. Linehan et al., Research on Dialectical Behavior Therapy: Summary of Non-RCT Studies (Seattle, WA: Behavioral Tech, 2016), https://behavioraltech.org/downloads/Research-on-DBT_Summary-of-Data-to-Date.pdf.

<tr>
<th><strong>Helping Women Recover: A Program for Treating Addiction</strong>&lt;sup&gt;111&lt;/sup&gt;</th>
<th>Helping Women Recover addresses substance use disorders by integrating the four theories of women's offending and treatment: pathways, addiction, trauma, and relational theories.</th>
<th>Evaluation results for the combined Helping Women Recover/Beyond Trauma program at an Oklahoma women's prison are the same as above.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Integrated Cognitive Behavioral Therapy (ICBT)</strong></td>
<td>ICBT is non-exposure-based, manual-guided individual or group therapy. ICBT consists of three learning and skill components designed to improve PTSD symptoms and substance use disorders: (1) patient education about PTSD and its relation to substance use and treatment, (2) mindful relaxation, and (3) cognitive restructuring/flexible thinking.</td>
<td>Trials of ICBT have resulted in significantly greater reductions in both PTSD and substance use disorders.&lt;sup&gt;112&lt;/sup&gt;</td>
</tr>
<tr>
<td><strong>Moving On</strong>&lt;sup&gt;113&lt;/sup&gt;</td>
<td>Moving On's goals are to provide women with opportunities to mobilize and enhance existing strengths and access personal and community resources. It also incorporates cognitive behavioral techniques with motivational interviewing and relational theory.&lt;sup&gt;114&lt;/sup&gt;</td>
<td>An evaluation of its use with women on probation in Iowa confirmed its effectiveness in reducing recidivism.&lt;sup&gt;115&lt;/sup&gt;</td>

<table>
<thead>
<tr>
<th>Model</th>
<th>Description</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>The Addictions and Trauma Recovery Integration Model (ATRIUM)</strong>&lt;sup&gt;124&lt;/sup&gt;</td>
<td>ATRIUM provides a blend of psychoeducation, process, and expressive activities, all of which are structured to address key issues linked to the experience of both trauma and addiction. This recovery model may be used in conjunction with 12-step or other substance use disorder treatment programs, as a supplement to trauma-focused psychotherapy, or as an independent model for healing.</td>
<td>ATRIUM was used in one of the nine study sites of SAMHSA’s Women, Co-Occurring Disorders and Violence Study. Across all sites, trauma-specific models achieved more favorable outcomes than control sites that did not use trauma-specific models.&lt;sup&gt;125&lt;/sup&gt;</td>
</tr>
<tr>
<td><strong>Trauma Addictions Mental Health and Recovery (TAMAR)</strong>&lt;sup&gt;126&lt;/sup&gt;</td>
<td>TAMAR is a structured, manualized 10-week intervention combining psychoeducational approaches with expressive therapies. It is designed for women and men with histories of trauma in residential systems. Groups are run inside detention centers, state psychiatric hospitals, and in the community.</td>
<td>Initial research indicates that women participants in TAMAR have significantly lower recidivism rates back to detention centers, improved self-esteem and coping skills, and reduced incidence of contracting HIV and other STIs.&lt;sup&gt;127&lt;/sup&gt;</td>
</tr>
<tr>
<td><strong>Trauma Affect Regulation: Guide for Education and Therapy (TARGET)</strong>&lt;sup&gt;128&lt;/sup&gt;</td>
<td>TARGET is an educational and therapeutic approach for the prevention and treatment of complex PTSD. This model provides practical skills that can be used by trauma survivors and family members to de-escalate and regulate extreme emotions, manage intrusive trauma memories experienced in daily life, and restore the capacity for information processing and memory.&lt;sup&gt;129&lt;/sup&gt;</td>
<td>In field trials with groups of low-income women in residential, intensive outpatient, or criminal justice diversion treatment for substance use disorders or domestic violence (80 percent of which were Black or Latina), 50 percent reported symptoms sufficient to warrant a diagnosis of PTSD prior to TARGET. Following 10 TARGET group sessions, only 20 percent continued to warrant a PTSD diagnosis.&lt;sup&gt;130&lt;/sup&gt;</td>
</tr>

<table>
<thead>
<tr>
<th><strong>Table 3 Continued</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Trauma Recovery and Empowerment Model (TREM)</strong></td>
</tr>
<tr>
<td>TREM is intended for trauma survivors, particularly those with exposure to physical or sexual violence. This model is gender specific: TREM for women and MTREM for men. This model has been implemented in mental health, substance use, co-occurring disorder, and criminal justice settings.</td>
</tr>
<tr>
<td>TREM groups have shown a very high rate of retention, even among women with multiple vulnerabilities and few supports. Pilot studies have indicated a high level of participant satisfaction with the group, with over 90 percent finding it helpful on a number of trauma-related dimensions, including recovery skill development. Preliminary studies of TREM have found improvement in overall functioning; mental health symptoms (including anxiety and depression); and trauma recovery skills (e.g., self-soothing, emotional modulation, and self-protection). In addition, these evaluations found decreased high-risk behaviors and reduced use of intensive services, such as emergency room visits and hospitalizations. Quasi-experimental study results showed advantages for using TREM over services as usual in both PTSD symptoms and drug and alcohol use.^{131}</td>
</tr>
<tr>
<td><strong>Treating Women with Substance Use Disorders: The Women’s Recovery Group Manual^{132}</strong></td>
</tr>
<tr>
<td>This manual emphasizes self-care and developing skills for relapse prevention and recovery. Grounded in cognitive behavioral therapy, this manual is designed for a broad population of women with substance use disorders, regardless of their specific substance of use, age, or co-occurring disorders.</td>
</tr>
<tr>
<td>Evaluations show that the Women’s Recovery Group Manual is effective, as demonstrated by reduction of substance use during and after treatment and increased group affiliation/bonding.^{133}</td>
</tr>
<tr>
<td><strong>Using Matrix with Women Clients: A Supplement to the Matrix Intensive Outpatient Treatment for People with Stimulant Use Disorders</strong></td>
</tr>
<tr>
<td>This guide enhances the counselor’s treatment manual in the Matrix series, addressing the specific needs of women who misuse stimulants. It contains materials to help counselors conduct intensive outpatient treatment sessions on relationships, trauma, body image, and family roles.</td>
</tr>
<tr>
<td>Studies have demonstrated that participants treated using the Matrix Model show statistically significant reductions in drug and alcohol use, improvements in psychological indicators, and reduced risky sexual behaviors. This supplement for women participants was developed in response to the unique needs and concerns of women in stimulant dependent treatment.^{134}</td>
